STEEL PROCESSING SERVICES

GUILLOTINING

Since 1981, Rollco has been a trusted provider of high-quality curved steel and alloy products to the construction and manufacturing industries.

Our comprehensive services enable us to process most requirements in-house, minimising the need for multiple orders and deliveries.

We're dedicated to meeting customer specifications while delivering the highest standards of quality.

Rollco is committed to staying ahead of the curve, continually addressing customer and industry demands to ensure we remain the go-to supplier for quality curved steel and alloy products in Australia.

PROCESS

Guillotining, or shearing, are reliable methods for cutting steel sheets or plates in straight lines, minimising distortion issues often associated with other cutting techniques like profile cutting. This cutting method is particularly advantageous when further processing is needed, such as bending or rolling, as it doesn't introduce additional stresses into the material.

Steel guillotining is widely used wherever large sheets or plates of steel need to be cut into smaller, straight sections for construction, fabrication, shipbuilding, transport, and heavy equipment manufacturing.

CAPACITY

Rollco offers high-precision guillotining services for sheet and plate processing.

With the ability to process mild steel, stainless steel and aluminium, Rollco ensures every job is completed with consistency, efficiency and quality craftsmanship.
